7th Seasonal Crop Report

(Issued by Department of Agriculture, Government of Alberta)

Edmonton, September 18, 1929.

Threshing is fairly general throughout the province, and grain in many cases is yielding higher than was anticipated. Threshing has been resumed in most districts after a short period of unsettled weather, which delayed operations to some extent, and with continued good weather will be completed somewhat earlier than was the case last year.

From reports received it is estimated by the Department that the average yields for the season will be between eleven and twelve bushels per acre. This is as close as the estimate can be made with any certainty, as the country must further returns are received from the three-month throughout the province. The above figures are based on the reports which have already come in.

According to an estimate arrived at jointly by the Department of Agriculture and the Dominion Bureau of Statistics, the wheat season in Alberta this year has been placed at 4,422,902 acres.

A very satisfactory feature of the present season's yield is the high quality of the majority of the wheat being threshed, many districts reporting a large percentage of No. 1 and No. 2. In some cases, however, the grade has been reduced by the presence of green kernels, but in very few cases is the grade below No. 3.

It is expected from the reports that there will be a shortage of seed corn available for next year's crop in many districts in the central portion of the province, but it is believed this demand can be met satisfactorily by other sections of the province where a heavier yield of corn is being threshed.

Negotiations have been under way between the Alberta Government and the railway companies regarding the free shipment of hay and feed into those districts where the crop is short. These arrangements have now been completed and the plan will be in operation after September 18. Farmers interested in taking advantage of this arrangement are asked to communicate with the Department of Agriculture where full information is available.

A careful survey made by the field representatives of the Department indicates that a comparatively small amount of hay will be required, as very excellent crops of alfalfa and clover and the dry and wet hay has permitted the cutting of hay on many sloughs, and the weather has been so good that the quality of the hay is of good, dependable on the length and severity of the winter, so that the hay will be of good feed in the autumn severely affected by drought.

SCOUT NEWS

The dance in aid of the Boy Scout Movement will be held in the Olympia Theatre on Friday, Sept. 20th. Come and make this a record dance and help swell the treasury fund. Tickets \$1.50 per couple, including supper.

Program in the movement continues to be highly satisfactory. Most of the boys have qualified for their 3rd Star, and are quite interested. Wayne Stanley is the new Cub Master and will be on hand for the next meeting. It is expected that we'll soon be able to send for the new uniforms, after which we will have a Scout troop that will compare favourably with any in the province.

Craigville News

On Monday and Tuesday of the week the local United Church was the meeting place of the Ministers of the Hanna Presbytery of the United Church of Canada, and good attendance was recorded. Various papers were read and topics discussed. On Monday, Rev. J. H. Hower, of Hanna, gave a lecture on astronomy, and a large audience was present and listened with much interest to the interesting exposition given. The ladies of the Church served supper in the Church basement on Tuesday evening, at which a good attendance was also present. The services were held simultaneously. Thorough addresses were given by Dr. Endicott, of Saskatoon, and Dr. Tross, Powell, of Calgary.

Mrs. E. A. Peterson, who has been visiting her son, Fred F. Peterson, here for the last few weeks, left on Sunday last for her home at New Westminster, travelling by Morris and Edmonton.

J. D. Halden, Minister of the United Church at Stewerton, B.C., visited his brother-in-law and sister, Mr. and Mrs. John S. Sims, last week, and left for home on Saturday.

STONELAW NEWS

A surprise party was held at the home of Mrs. Kivett on Sept. 15th, when about fifty guests were present. Mrs. Kivett and her guests were greeted with a lovely one o'clock tea.

The ladies came with flowers for all, and a good singing program. Louis Healy is ill with scarlet fever.

Mr. Francis and Owen McKnight have been out of quarantine for some time.

News that radio broadcasts during have proved satisfactory will satisfy persons who have listened to or dreamy students.

OFFICIAL HOG GRADES

The following are a few of the official hog grades included in the regulations issued by the Department of Agriculture to separate the different types, weights and qualities of hogs produced in the Dominion in accordance with market average, market quality. This work is determined in the main by consumer demand and the selling value of the commercial cuts produced from the carcasses of different grades of hogs.

GRADE 1—SELECT HOGS

Conformation, weight and finish are the determining factors which set the standard for this grade. Weight limits are 180 to 220 pounds W.G.O. at peak weight and maturity, or 160 to 200 pounds fed and watered at stockyards or at local shipping points. The ideal is the bacon hog that is rounded at 300 pounds, live weight. Breeding in the first essential in producing bacon hogs, although feeding is equally as important. Well-fed, properly finished hogs have long, straight, level backs, a medium layer of fat along the ribs, which should not measure less than 1 inch in thickness at the narrowest point in the back and not more than two inches in thickness over the shoulder.

Carcasses from under-fed hogs are very undesirable. Length and type will not offset the poor build, thin streaks and the general low quality of all cuts from an underfed bacon hog. Carcasses feeding with such a poor carcass or barley, during the first three months of the pig's life, tends to shorten the carcass and develop too heavy a fat covering. Daily hygienic, good, clean feed, and a moderate amount of exercise, length, bone weight, permitting of finishing at proper maturity on the more intensive feeding system.

Farmers, who aim to market a high percentage of hogs of the Select Hog Grade, should first make sure that their breeding stock is of the right type and conformation; they should then select in accordance with recognized and approved methods and also to have their pigs properly fed for market to close to 200 pounds possible.

GRADE 2—BACON

The weight and maximum weight limits are 160 to 200 pounds for the carcass, and 180 to 240 pounds for the carcass, and maturity, or 160 to 200 pounds fed and watered at stockyards or at local shipping points. This grade will be the same general character as the Select Hog Grade, but they will not be so well finished, and in general quality as compared with the Select Hog Grade is thought to take one of the hogs type hogs which is not quite up to the hog standard.

The widespread distribution of bacon type breeding stock, combined with the increasing tendency to feed for heavier carcasses in the general average of a large percentage of our hog population, and this grade will provide some encouragement to the producer who has tried to and is continuing to improve his hogs, but has not yet achieved a Select Hog Grade.

Carcasses from the Bacon grade will find a ready demand both on the domestic and export markets, and at the same time will leave the Select Hog grade as the ultimate goal and the incentive for continued improvement in the quality of our hog production.

GRADE 3—HOGS

The weight and maximum weight limits are 160 to 200 pounds W.G.O. at stock yards and maturity, or 180 to 240 pounds fed and watered at stockyards or at local shipping points. This grade will be all hogs of smooth finishing and good finish not conforming to the standards for the Bacon grade.

This grade will take in the lower end of the old Thick Stock grade in the same way that the Bacon grade takes in the upper or improved end. It adds to this, the minimum weight here is lower, 160 to 200 pounds below that of the old Thick Stock grade, so as to take in the upper end of the old stock type hogs, and to provide a considerable portion of the hogs in the Thick Stock grade. Now that the three ends of the hog hog grade has been taken care of, the grade will change the hogs that seek killing here under 160 pounds in weight will make their selections from the old Thick Stock grade.

The heavier grade will take in hogs of varying finish in finish and breeding. Carcasses from this grade of hogs will find their outlet on the domestic market for the home or export trade. The Canadian household is to-day demanding quality in fresh and cured pork, so that there will be a tendency to discriminate against the extreme in the grade, which will be a tendency to average prices for the grade as a whole.

GRADE 4—AND 5—HEAVY AND EXTRA

HEAVY

When grading feed into these hogs, the number of hog grading into these grades amounts to 6.5 per cent of the total (1928). Farmers quickly learned that one weight hog was not popular at marketing points, with the result that marketing in these grades have been reduced.

Hogs going into either of these grades may be of the Bacon type or the Heavy type, but in either case the carcass is too heavy for the popular market. It is paid to finishing hogs, and the carcass is too heavy for the popular market, very few will be marketed at over except some more from some farms that have heavy carcasses which the market ignores in these grades.

Health Service of the Canadian Medical Association

AGE INCIDENCE OF TUBERCULOSIS

The importance of protecting young children against tuberculosis has been frequently pointed out. Perhaps because of this, it may be judged from the opinion expressed by various people that the number of adults are under the impression that they need not take any particular care, and that when they pass their fortieth year, they run no further danger of incurring tuberculosis. In order to correct this false idea, we are giving the age of death for this disease in Canada, in the year 1928:

Under 1 year.....233
1 to 5 years.....230
5 to 9 years.....229
10 to 14 years.....228
15 to 19 years.....226
20 years and over.....225

From these figures it will be evident that, while tuberculosis is chiefest toll during early adult life, causing a high percentage of all deaths from 20 to 40 years of age, it is not by any means confined to any period of life.

A large percentage of all people take their first lesson, near the beginning of their lives, the germs of tuberculosis. In most cases, these germs are taken in by the dust and the germs are never actually developed. The germs are there, however, and are a constant threat. They are most apt to develop when the immune system of the body is weakened through the attack of some disease, such as influenza, or even a common cold or a severe cold. When the immune system is weakened, the germs will develop and cause disease. It is not by any means confined to any period of life.

For all these reasons, it is evident that, throughout life, care should be taken to keep the body fit and to avoid infection.

Questions concerning Health, address the Canadian Medical Association, 184 College Street. Toronto. Will be answered personally in letter.

Testing Methods

Herewith are given some simple instructions for testing the following:

WATER—Draw off a tablespoonful of water and let it stand for 24 hours. If on the following day the water appears cloudy, it contains impurities.

LENS—Suck a sample in Olive oil for a few minutes; dry carefully between blotting paper, and hold it up to the light. If uniformly transparent, it is pure. If not, it is slightly opaque it has been mixed with cotton.

GLASS—Put a sample into a small bottle, add a touch of the quantity of ammonia and shake well. If the mixture becomes thick, creamy, more the oil is pure but if it has a granulated appearance other oils have been added.

MILK—Tip the point of a polished needle into the milk, remove and hold perpendicular, with the point at the bottom. If some of the milk adheres to the point the milk is pure, but if it runs off the needle has been added. To test if the milk has been "creamed" mix a sample after it has lain for an hour or so. If the skimmed milk has a bluish green color, it is pure. If it is yellowish it contains impurities.

PLANT—Place in cold water. If they sink to the bottom and rise they are fresh; if they sink and stay at the bottom they are not absolutely fresh, and if they float they are not fresh.

Many Families Are Settled on Farms

With ninety-one more settler families located on farms in Canada during August, the total for the year reached 908 for the eighth month, says August 31, W. R. Dick, superintendent at Calgary said last Thursday.

Of the quota for August, 63 were located on Alberta farms. Twenty-four were located permanently on 5,186 acres of land.

At present there are under the supervision of the Department of Agriculture, 4,008 settler families occupying 1,798,000 acres of land, costing a total price of \$32,000,000. Mr. Dick said.

For the eighth-month period, 631 settlers were placed temporarily in agricultural employment.

Officers of the freight traffic department of the Great Northern Railway prominently concerned in the case are shown above. They are: (1) J. J. McLaughlin, Assistant Freight Traffic Manager, who has been appointed General Freight Agent, and (2) J. J. McLaughlin, who becomes General Freight Agent, Winnipeg.

Department of the Canadian National Service Medal for recent retirements and promotions (1) M. Horn, who has been promoted to Major (2) J. M. Macrae, who has been promoted to Major, Vancouver; (3) W. Hatley, who has been promoted to Major; (4) A. E. Roosevelt, General, retired after 52 years of service.

The experiment was made to determine the practicability of delivering perishable freight from a plane by the parachute method.

Glacier Park, British Columbia

Glacier National Park, British Columbia, derives its name from the magnificent Illecillewaet Glacier, which is the chief centre of interest within its boundaries. This glacier flows from the Illecillewaet snowfield which is ten square miles in extent. From the crest of the snowfield to the base of the glacier there is a drop of 3,000 feet.
